They are used to treat, prevent or diagnose autoimmune diseases such as IDDM (Insulin dependant diabetes mellitus). The present DNA sequence is reverse PCR primer, Intex used for sequencing mammalian PAC93: DNA which is used as a template for determining the complete II-12 p40 genomic

The patent discloses a method of screening mammals for autoimmune diseases by identifying polymorphisms in interleukin (IL)-12 p40 gene. The methods and kits of the invention are used for screening individuals families and populations for disease conditions or predispositions for the development of a disease condition which is characterised, exacerbated or associated with Th/Th2 dysregulation in a mammal. They are used to treat, prevent or diseases such as IDDM (Insulin dependant diabetes mellitus). The present DNA sequence is a PCR primer which is used for detecting polymorphism in mammalian IL-12 p40 p40 gene.

Screening an unknown base sequence at a defined site of a testranded nucleic acid for use in DNA diagnosis and therapy, DNA chip, fluorescence yield and pattern-based method. target single-Y, comprises a

Example 1; Page 13; 53pp; Japanese.

acid base sequence. The method comprises preparing a probe array, hybridising with the probe array, measuring the fluorescence yield in the reaction, obtaining a template pattern, producing a sample pattern, and comparing the sample pattern with the template pattern. The method is useful for specifying an unknown base sequence at a defined site of a target single-stranded nucleic acid, which is useful for analysing a nucleic acid, base sequence. The method is supplicable in DNA diagnosis and therapy, and is useful in medicine and biology. Measuring the fluorescence yield allows the detection of a one-base mismatch which can be considered to produce high detection of a one-base mismatch which can the DNA probe is used so the difference in thermostability is less The present invention relates to a method of analysing an unknown nucleic acid base sequence. The method comprises preparing a probe array.

                                                                                                                                                             The invention relates to a novel method for detecting a complex formed between a probe and its complement. The method is used for detecting a complex formed between an oligonucleotide of known base sequence and a complementary probe, and for evaluating if the sequence is contained in liquid samples, or the level of binding by using the oligonucleotide as the detecting probe. The sequence represents a probe used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 18

Enhancing a plant trait for studying biochemical pathways, comprises transforming a plant with an expression vector having a sequence encoding flavin-containing monooxygenase, expressing the monooxygenase and measuring the trait.

Example 2; Page 21; 41pp; English.

This invention relates to a method for enhancing a trait in a plant. The CC method comprises transforming a plant with an expression vector comprising a nucleotide sequence encoding a flavin-containing comprising a nucleotide sequence encoding a flavin-containing comprising a nucleotide sequence encoding a flavin-containing comprising a nucleotide sequence encoding a trait (such as increased typocotyl elongation, root thickness, root hair development, lateral root initiation, apical dominance, epinastic leaf growth, flowering node containing, fruit yield, auxin levels (preferably endogenous auxin levels), and growth and yield, parthenocarpic fruit production or root development alteration, where the increased root development is selected from increased root length, root diameter, rate of elongation, root hair correctly endoneus or a dicotyledonous plant, more preferably a compocityledonous or a dicotyledonous plant, more preferably A. thaliana cor a tobacco plant. The method of the invention is useful for studying contentical pathways such as the interaction between two growth cregulators or root development, and for oxidising xenobiotics in plants. The present sequence represents a sequencing primer used to sequence the containing monooxygenase (FMO) YUCCA expression vector of the invention

                                                                                                                                                   The invention relates to antisense compounds targetted to a nucleic acid molecule encoding PI3K p85 to inhibits its expression. Antisense compounds of the invention are used for treating obesity, Type 2 diabetes and hyperproliferative condition e.g. cancer. They may also be useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. Antisense compounds either alone or in combination with other antisense compounds or therapeutics can be used as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells and tissues. They are commonly used as research reagents and disconciling the property of the compounds of the entire complement of genes expressed within cells and tissues. They are commonly used as research reagents and disconciling the property of the commonly used as research reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           modified_base

                                                                                                                                The sequence represents a two-base mismatch probe designed to detect a variation a specific base in the p53 gene sequence. The invention relates to a novel method for screening for a variation in a nucleic acid sequence. The method involves using a DNA array in which a group of probes which will give strong signals forming hybrids with a normal gene sequence, and a group of probes having sequences expected to form hybrids with gene variants are separately arranged. The method is useful for screening for the presence or absence of variation in a nucleic acid sequence. The method is also useful for mass screening to determine rapidly the presence or absence of a gene variation without need of an
                                                                                                                                                                                                                                                                                                                               Screening for gene variation by using DNA array in which probes giving strong signals forming hybrids with normal sequence, and probes having sequences expected to form hybrids with variants are separately arranged
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 31-AUG-2000; 2000JP-00263396

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting angiogenesis in a subject, involves administering antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bratzler RL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  14-DEC-2001; 2001WO-US048458

cc include the acid sensing ion channel (ASIC)2A and ASIC3 protein or their creating that saving 80% sequence identity, the channel being activated by croms, acids, low pH solutions, the nucleic acids encoding the capturents, a recombinant bicistronic vector comprising a nucleic acid encoding at least two individual subunits or variants of ASIC-2S.2, a constraint or a domain which is capable of disrupting assembly of the ion channel and ant/agonists of the ion channel. The polypeptides and comprising the vector, an antibody raised against one of the computation or a domain which is capable of disrupting assembly of the ion channel and ant/agonists of the ion channel. The polypeptides and complete channel for diagnosing a disease or a susceptibility of a disease in a subject related to expression or activity of the location of the complete channel (e.g. by gene therapy using the vector). Such the teromaltimeric channel (e.g. by gene therapy using the vector). Such and AIDS (acquired immunodeficiency syndrome) related, cancer composed the channel sclerosis and dementias, including AIDS-related, and amyotrophic disease, Huntington's disease, Creutzfeldt-Jacob disease, and amyotrophic capturalstons, epilepsy, stroke, anxiety and depression. They are also conventations and bleeding, ASIC-2S.2 plays a role in the regulation of certainess and bleeding, ASIC-2S.2 plays a role in the regulation of sequence is an RT (reverse transcriptase) PCR primer used to measure the crissue distribution of mRNA encoding human ASIC3A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New heteromultimeric proton-gated ion channel for diagnosing, treating diseases associated with expression of the channel e.g. neurodegenerative diseases, comprises two different types of acid sensing ion channel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              amiloride and gadolinium-sensitive proton-gated cation channel (ASIC-2S.2), where the individual components of the heteromultimeric channel include the acid sensing ion channel (ASIC)2A and ASIC3 protein or the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 3; Page 102; 105pp; English.

The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, lung cancer, Hodgkin's lymphoma, non-Hodgkin's lymphoma, melanoma, mysloma, oral cavity cancer, ovarian cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            03-DEC-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        08-AUG-2002
                                    polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is a genotyping PCR primer for the gene encoding one of the proteins listed above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an

The invention relates to an isolated nucleic acid from a human gene composition aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRB1), C1 esterase inhibitor (C1NH), kallikrein C1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme C2 (ACE2) or protease inhibitor 4 (P14), comprising at least one C2 polymorphic position. Also included are (1) a probe that hybridises to a C3 polymorphic position as provided in the detailed summary of single C4 conclective polymorphisms comprising additional 5 and 3 flanking genomic C5 sequence; (2) analysing (M1) at least one nucleic acid sample comprising C6 obtaining the sample from one or more polymorphic positions in a gene C7 concleic acid sequence at one or more polymorphic positions in a gene C8 conding a protein selected from the group above; (3) constructing (M2) C6 haplotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder C6 using the polymorphic data; (5) a library of nucleic acids, each of which C6 comprises one or more polymorphic positions within a gene encoding a condition selected from the group above; and (6) genotyping (M4) an individual comprises one or more polymorphic positions within a gene encoding a condition with a known data set. The genes, (M1, M2, M3 and M4) cast one positions with a known data set. The genes, (M1, M2, M3 and M4) cast one positions are useful for detecting, diagnosing, treating,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ss; aminopeptidase P; XPNEP2; bradykinin receptor B1; primer; BDKRB1; tachykinin receptor B1; TACR1; C1 esterase inhibitor; C1NH; kallikrein 1; KLK1; bradykinin receptor B2; BDKRB2; gene therapy; angiotensin converting enzyme 2; ACE2; protease inhibitor 4; P14; polymorphism; haemangioma; tumour; sarcoma; Crohn's disease; trachoma; cardiovascular disease; angina pectoris; hypertension; heart failure; myocardial infarction; ventricular hypertrophy; vascular disease; aneurysm; embolism; thrombosis; coronary artery disease; angioedaema; arteriosclerosis; atherosclerosis; hypersensitivity; sapsis; PCR; autoimmune disease; inflammatory arthritis; cancer; wound; genotyping; viral infection; bacterial infection; fungal infection; COPD; Chronic obstructive pulmonary disease; enterocolitis.

                                              involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis and/or atherosclerosis, and hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is a genotyping PCR primer for the gene encoding one of the proteins listed above

```

compound, preferably an antisense oligonucleotide, that hybridizes inhibits the expression of phosphoinositide phosphatase (PTEN), for a ting diseases such as diabetes, or a hyperproliferative condition.

for modulating the expression of phosphoinositide phosphatase (PTEN). The antisense compound is used to inhibit the expression of PTEN in cells or tissues, preferably human, or rodent, such as mouse or rat, liver, kidney or adipose cells or tissues. It is used to treat a disease or condition associated with PTEN, such as metabolic disease or condition preferably diabetes, especially Type 2 diabetes, or a hyperproliferative condition. It is also used to decrease blood glucose or insulin levels in an animal, preferably a diabetic human or rodent. It is also used to decrease insulin resistance, or increase insulin sensitivity, in an animal, preferably a diabetic human or rodent. It is used to decrease insulin resistance, or increase insulin sensitivity, in an animal, preferably a diabetic human or rodent. It is used to decrease blood triglyceride or cholesterol levels in an animal preferably a diabetic human or rodent. It is used to decrease blood triglyceride or cholesterol levels in an animal preferably a diabetic human or rodent. human or rodent. sequence is an an antisense oligonucleotide compositions and methods therapy. The PTEN). The

                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis, ABL42957 to ABL45323 to ABL45634 represent PCR primers for human chromosome 1936-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed the maximum in the specified discrimination Nos. to array the multiwell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         multiwell plates;

The present invention describes a method of arraying genome clones. The comprises: (a) clones of the genomic libraries contained in comultiwell plates numbered for discrimination are mixed in each of the cultiwell plates; (b) a primer designed based on the chromosome marker comultiwell plates; (b) a primer designed based on the chromosome marker comultiwell grades to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant complified product to specify the discrimination Nos. of the multiwell completes containing the clones having said marker sequence; (d) the order completes containing the clones having said marker sequence; (d) the order completes; (e) the specified discrimination Nos. to array the multiwell completes; (e) the clones in the multiwell plates of the specified completes; (e) the clones in the multiwell plates of the specified completes; (e) the marker specified by using the above primer; (g) signals care detected from the amplified by using the above primer; (g) signals care detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and ABL45223 to ABL45232 to ABL45233 to ABL45333 to ABL45333 to ABL45334 consent for limers for human chromosome 1936-35 DNA, and ABL45323 to ABL45334 consent for size in the recent of the r

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprises cells of type(s) normally found in healthy tissue corresponding comprises cells of type(s) normally found in healthy tissue corresponding comprises cells of type(s) normally found in healthy tissue corresponding comprises cells of type(s) normally found in healthy tissue corresponding comprises cells and/or tissue to be augmented. Comprise cells and/or bone marrow stromal cells and/or gel forming substance. The cells and/or bone marrow stromal cells. The devices and methods are consecuted with primary osteoarthritis, or or other articular cartilage damage caused by sporting injuries or correct trauma. They are also useful for tissue augmentation for cosmetic purposes, e.g. treatment of scars or facial wrinkles. The present devices and methods provide treatment that is less traumatic than previous art. Comparedable polymers in that their gradual degradation steadily creates composes, e.g. treatment that is less traumatic than previous art. Comparedable polymers in that their gradual degradation steadily creates composes, e.g. treatment that is less traumatic than previous art. Comparedable polymers in that their gradual degradation steadily creates composes, e.g. treatment their gradual degradation steadily creates composes, e.g. the present device offer advantages over non composes, e.g. the present composes of the articular cartilage. Another composes its ability to be administered by injection if desired. The beads or particles provide mechanical and space-filling benefits while cissue regeneration is progressing, by offering physical support and composes of the present sequence represents a PCR primer composes of the present sequence represents a PCR primer composes of the present invention is progressing, in the examples of the present invention is progressing, by offering physical support and composes of the present sequence represents a PCR primer composes of the present invention is progressing, by offering physical support and compose of the present sequence composes of the present invention c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                 Query Match
                                                                                                                                     probe array - in which part of a probe for capturing a target substance is fixed at a plural of the matrix sites on the surface of a probe array substrate. In the method of the invention the units for constituting the probe are combined successively and, at the final stage of the successive synthesis, a labelling substance is combined to the end of the probe and extended to a desired chain length. The method of the invention is useful for the production of a probe array. The present DNA sequence represents an oligonucleotide that was used in an example of the invention

```

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of

Human leukocyte antigen (HLA) ty individuals e.g. by determining transplanting between them.

                                                                                                                                   The present invention describes a method for determining simultaneously the reactivity of a first sample with other samples, in which the second to the 2 plus nth (n is not less than 1) samples having different properties are arranged independently on a substrate, on whose surface the first sample is already present, and the reactivities between the first sample and each of the second to the 2 plus n-th samples are determined. Also described is a tissue sample matrix in which several samples from different sources are present on each matrix divided on a substrate. The method is used for determining simultaneously the reactivity of a first sample with several other differing samples. ABL59636 to ABL59701 represent oligonucleotide probes used in an example from the present oligonucleotide probes used in an example

                                                                                                                                                                              The invention comprises a synthetic DNA selling system using the internet. The system displays a purchase order menu display, with the number of base sequences of DNA from which the orderer selects a DNA. The order information is transmitted to a successful bidder side server which orders for production and delivery of selected synthetic DNA. The system of the invention is useful for marketing synthetic DNAs of different base sequences and concentrations according to the desire of the user, especially genes concerned with human major histocompatibility complex (MHC). Oligonucleotides ABT06196 - ABT06278 are used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               24-OCT-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic DNA selling system using the Internet, displays purchase order menu to orderer's terminal and initiates production of selected DNA for the successful bidder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 JP2002074089-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABT06232;

junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapputic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of buildunione or lung sufficient in a subject, for reducing levels of adenosine. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or Disclosure; SEQ 5' and 3' intron-exon junctions, or regions within 2-10 junctions of genes encoding a polypeptide associated with The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, ID NO 13418; 872pp; English. nucleotides which has

Novel gene cluster responsible for synthesis of leinamycin Streptomyces atroolivaceus useful for making various peptic polyketide, and/or hybrid polypeptide/polyketide metabolite and/or

Claim 1; Page 28; 185pp; English.

cc and owrs *** tribuly ***). Defining the analysis and over an inversal and considered by several Streptomyces species. It exhibits broad spectrum CC antimicrobial activity against Gram-positive and Gram-negative bacteria, CC but not against fungi. The polypeptides encoded by the Lnm biosynthesis CC gene cluster ORPs are useful for chemically modifying a molecule in a CC mammalian, yeast, plant, fungal, or insect cell. The molecule is an CC endogenous metabolite produced by the host cell or exogenously supplied CC entogenous metabolite produced by the host cell or exogenously supplied CC are useful for converting an apo-carrier protein to a holo-carrier CC are useful for converting an apo-carrier protein to a holo-carrier CC protein. Lnm shows potent antitumour activity in tumour models in vivo. The Lnm gene cluster modules and/or polybetide, and/or hybrid converting an apo-carrier protein to a holo-carrier CC making various peptide and/or polyketide, and/or hybrid comains are useful for CC useful alone, or in combination with other active domains to modify CC useful alone, or in combination with other active domains to modify CC useful alone, or in combination with other active domains to modify CC make various modified Lnm. Lnm, its analogue, or other polyketide, or hybrid polyketide/peptide metabolites are useful as and/or to permit Lnm production in cells and/or to CC make various modified Lnm. Lnm, its analogue, or other polyketide, CC complity individual ORPs of the S. atroolivaceus leinamycin biosynthesis CC camplity individual ORPs of the S. atroolivaceus leinamycin biosynthesis atroolivaceus leinamycin (Lnm) biosynthesis gene cluster containing open reading frames (ORFs) (ORFs -35 through -1, ORFs lnmA through land ORFs +1 through +9). Leinamycin is a novel anti-tumour antibioti The present invention relates to the isolation of the Streptomyces antibiotic

CC toxicological response to an agent, which comparises comparing the expression profile of one or more human toxic response genes to a CC reference gene expression profile indicative of toxicity, and so CC determining the presence of a toxic response to the agent Also CC determining the presence of a toxic response to the agent Also CC determining the presence of a toxic response to the agent in ABS2842 CC from the genes corresponding to the partial sequences given in ABS2842 CC response gene plays a role on toxic response pathways by determining the capression profile of the gene after exposure of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising: (a) capposing cells to an agent; (b) obtaining the test gene expression profile of a gene with a similar function or toxic pharmaceutical or industrial agent, and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of agene with a similar function or predicting and determining toxicological responses on a cellular, organ or system level. The arrays comprising the human genes are useful for toxicological screening of drugs, pharmaceutical compounds and chemicals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neft
                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method (M1) for determining a toxicological response to an agent, which comprises comparing the toxicological response to an agent toxic response genes to a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein. The ISP protein is useful in diagnosing, treating or ameliorating female infertility (e.g. using gene therapy), particularly by modulating the process of hatching and implantation of the embryo. The protein inhibitor is useful as contraception. This sequence represents a reverse transcriptase PCR primer used to isolate DNA encoding implantation serine proteinase 1 (ISP1) from embryo and

Treating non-allergic inflammatory diseases, such as psoriallergic contact dermatitis, latex dermatitis or inflammate disease by administering an immunostimulatory nucleic acid. inflammatory

Disclosure; Page 26; 229pp; English.

The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as useful for treating non-allergic contact dermatitis, latex dermatitis or provinces allergic contact dermatitis, latex dermatitis or provinces and the subject of inflammatory bowel disease e.g., ulcerative colitis or This sequence represents an immunostimulatory nucleic arepsilonCrohn's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated 16S rDNA sequence indicative of a dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism is useful for dechlorinating chlorinated compounds which involves contacting a chlorinated compound with the organism. Oligonucleotide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is behalorespirating bacterial 16S rDNA amplifying PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated 16S rDNA sequence useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in

                                                                                                                                                                                                           The present sequence is that of a PCR primer based on a conserved region of Thermus aquaticus, Thermus thermophilus, Thermus filiformis, Thermus caldophilus and Thermus flavus nucleic acid polymerases. It was used as C terminal primer, with the N-terminal primer given in ACF05367, in a PCR amplification of Thermus igniterrae strain ID RF-4 (ATCC 700962) DNN. A gene fragment was obtained, and subsequent PCRs yielded a full-length coding sequence (see ACF05363) for T. igniterrae nucleic acid polymerase. The invention provides nucleic acid polymerase polymucleotides, vectors, host cells and polypeptides, including mutants having reduced 5, 3, 5, 3, exonuclease activity and/or reduced bias against ddWTP incorporation. The wild-type and mutant enzymes are used in claimed methods for thermocyclic nucleic acid amplification, especially strand displacement amplification or PCR, and for primer extension
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated Thermus igniterrae nucleic acid polymerases and nucleic acids encoding the polymerases, useful for DNA synthesis, primer extension, DNA sequencing, reverse transcription, or DNA and RNA amplification procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  primer extension;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          acid polymerases from Thermus scotoductus. Also described: (1) an Cisolated nucleic acid (I) encoding a nucleic acid polymerase from Thermus scotoductus strain x-1, ATCC Deposit No. 27978; (2) an isolated DNA Colymerase polypeptide from Thermus scotoductus strain x-1, ATCC Deposit No. 27978; (3) an isolated nucleic acid (II) comprising any of a set of Claucleic acid sequences (S1, see ADA50425 to ADA50436) which encodes a nucleic acid polymerase; (4) an isolated nucleic acid (III) encoding a nucleic acid polymerase; (4) an isolated nucleic acid (III) encoding a concleic acid polymerase; (4) an isolated nucleic acid (III) encoding a nucleic acid polymerase comprising any of a set of 16 amino acid sequences (S2, see ADA50389 to ADA50404); (5) isolated nucleic acid polymerases (III), and especially expression vectors in Claurerases (I), (II), or (III), and especially expression vectors in which the nucleic acid polymerase gene is operably linked to a promoter; (7) a host cell comprising an isolated nucleic acid molecule encoding a nucleic acid polymerase from Thermus scotoductus strain X-1, ATCC Deposit No. 27978; (8) a host cell comprising (I) or (III); (9) a kit comprising a container containing a nucleic acid polymerase comprising any of amino acid segmences (2); (10) normalicial acid polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     container containing a nucleic acid polymerase comprising any of amino acid sequences $2, (10) preparing (M1) a nucleic acid polymerase comprising any of amino acid sequences $2 by incubating a host cell comprising an encoding nucleic acid under conditions sufficient for RNA transcription and translation; (11) a nucleic acid polymerase prepared by M1, (12) synthesising DNA (M2) comprising contacting a polypeptide comprising any of amino acid sequences $2 with a DNA under conditions sufficient to permit DNA polymerisation; (13) a method (M3) for thermocyclic amplification of nucleic acid, and (14) a method (M4) of primer extension. The nucleic acid is useful for producing nucleic acid polymerases having improved sequence discrimination, better salt tolerance or varying degrees of thermostability with applications e.g. in PCR and DNA sequencing. The present sequence represents a PCR primer for Thermus scotoductus nucleic acid polymerase, which is used in an example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represent an immunostimulatory nucleic acid of the invention.

The molecules of the invention demonstrate cytostatic activity whilst the method may be useful for selecting target and target binder pairs for preparing a composition for treating cancer. Furthermore, the method may be utilised during gene therapy procedures. The current sequence is that of the PCR primer of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Selecting target and target binder pairs for preparing treating cancer by mixing in a reaction vessel phage expired target binders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 18; SEQ ID NO 205; 172pp; English.
      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010 ABC99389, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
                                                                                                                                                                                                                                                                                                                               Set of oligonucleotides, useful for diagnosis and cell designed to detect single-nucleotide polymorphisms and methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-APR-2000; 2000DE-01019173

No data for this patent did not form part of the printed was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosts and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABP00010-ABF99989, ABH00010-ABF9989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; sin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Set of oligonuclectides, useful for diagnosis and cell typing, designed to detect single-nuclectide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotide

described in the

method of the invention

RESULT 1201 AAS98785 ID AAS9878 밁 The invention describes a novel isolated polynucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for colony stimulating factor I receptor (CSPIR) gene, found on The polymorphic are useful for improving the discovery and development of compression of the discovery and development of compression gene, found on The compression of the haplotypes can be used to validate CSFIR activity. e.g., and inflammatory disorders and the haplotypes can be used to validate CSFIR as a candidate target for treating a specific condition or disease predicted to be associated with CSFIR activity. Genotyping the CSFIR as a candidate target compared to the protein or disease predicted to be associated with CSFIR activity. Genotyping the CSFIR gene of an individual can also be useful in studying the expression and function of CSFIR, and in compression of the variation on the biological activity and in studying the effect of the variation on the biological activity of CSFIR as well as on the variation on the biological activity of CSFIR as well as on the compound of the variety of diagnostic and prognostic formats and therapeutic competed against CSFIR protein, and for testing the efficacy of the protein and compounds. Allele specific oligonucleotides are seful as probes and primers, and for testing the efficacy of the phenotypic competition of the invention provides a method for identifying lead compounds that are more likely to show the compound of the invention provides a compound of the invention collective primer used for detecting CSFIR gene polymorphisms, and constitution collective primer used for detecting CSFIR gene polymorphisms, and constitution collective primer used for detecting CSFIR gene polymorphisms, collective detections collective.                            ce variant of an acetylcholinesterase (ACHE) gene or fragment, protein or complement, the variant comprising an ACHE isogene defined by a haplotype selected from haplotypes 1-20 listed in the specification. Also included are methods for haplotyping and genotyping the ACHE gene of an individual, a method for predicting a haplotype pair for the ACHE gene of an individual, a method for identifying an association between a trait can at least one haplotype or haplotype pair of ACHE gene, recombinant combinement or renoded by the polymorphic variant sequence, an isolated combined expresses ACHE protein encoded by the first nucleotide sequence or encoded by the polymorphic variant sequence, an isolated comparise troring and assaying for binding activity, a computer common anthology for ACHE gene which comprises ACHE isogenes defined by system for storing and analysing polymorphism data for ACHE gene and a system for storing and analysing polymorphisms are useful comparisons. The polymorphisms are useful for scudying the biological function of ACHE as well as in identifying condition or disease protein for the treatment of disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting ACHE to treat a specific condition or disease predicted to be associated with ACHE activity e.g. condition or disease predicted to be associated with ACHE activity e.g. cancer, leakemia, and tumours. The ACHE gene maps to human chromosome condition be used to detect the polymorphic variants of the invention condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, ss, probe, allele specific oligonucleotide; ASO; ACHE; acetylcholinesterase; polymorphic variant; haplotyping; genotyping; neurological disease; Parkinson's disease; Alzheimer's disease; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human Acetylcholinesterase gene allele specific probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       26-FEB-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAS96144 standard; DNA; 15

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                           This invention describes a novel isolated genes and haplotypes of the CC human aldehyde dehydrogenase 5 (ALDH5) gene containing polymorphic sites. CC The polymorphic ALDH5 variant is useful in studying the effect of the CC variation on the biological activity of ALDH5 and on the binding affinity of candidate drugs targeting ALDH5 for the treatment of alcoholism and CC alcohol-induced disorders. Polymucleotides comprising a polymorphic gene CC variant or fragment may be used for therapeutic purposes. ALDH5 protein concern candidate drugs targeting the ALDH5 protein. ALDH5 proteins may be used in assays to measure the binding affinities of one concern candidate drugs targeting the ALDH5 protein. ALDH5 proteins may be used to generate antibodies. Haplotyping method can be used by concern candidate antibodies. Haplotyping method can be used by concern the total condition or disease predicted to be associated with ALDH5 cativity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with ALDH5 activity. Information on polymorphisms on the ALDH5 as well as in condition for the standard trials of disorders in dentifying drugs targeting this protein for the treatment of disorders called to its abnormal expression or function. The products of the convention have antialcoholic activity. This sequence represents a human and convention and products of the convention of allohes appecific oligonucleotide described in the disclosure of the convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Sequences ABA02205-ABA02282 represent antisense oligonucleotides targeted to the human CCAAT/enhancer-binding protein alpha (C/EBP alpha) gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human C/EBP alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels by quantitative real-time PCR. A similar investigation on mouse C/EBP alpha expression was performed using a subset of the antisense oligonucleotides that were

The C/EBP family of proteins are a family of transcription factors which regulate the expression of wide range of genes that control normal tissue development, cellular function, cellular proliferation and functional differentiation. C/EBP alpha (also known as CEBPA) is primarily found in tissues involved in energy metabolism which have a capacity to metabolise lipids, cholesterol and other sterols. It is thought to be involved in the regulation of adipocyte and chondrogenic differentation, and is also involved in follicular development and ovulation, steroid-induced cell cycle arrest in the liver, in controlling glucose transporter GUTT2 promoter activity, in the hormonal regulation of metabolism, and in granulocyte development. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
```

The invention relates to novel polymer conjugates of hedgehog proteins which have increased bioavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer comprising a polyalkylene

Example 6; Page 77; 157pp; English.

CC glycol group, with the proviso that the polymer is not conjugated to the Neterminus, or to lysine residues of the hedgehog protein used in the conjugate may be a wild-type or mutant Sonic hedgehog (Shh), Indian hedgehog (Ihh) or Desert hedgehog (Dhh) protein, or may be condifying accessible amino acid side chains, and determining the effect the position and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management of inflammatory and autoimmune disease, and cancers. In particular, they can be used to prevent preventing or ameliorate neurological disorders, and isease; allowers, including various neurological disorders (e.g., Parkinson's disease, Huntington's disease, Alzheimer's confiscated neurological disease, and cancers. In particular, they can be used to prevent preventing or ameliorate neurological injury and trauma; immunological diseases, Huntington's disease, Alzheimer's confiscase); stroke; and malignant gliomas, meduloblastomas and concerns in increased half-life, altered trissue distribution (such as colored proved ability to stay in the vasculature for longer periods of time); increased stability in solution, protection from proteolytic degradation, or reduced immunogenicity. In particular, the ability to remain in the vasculature for prolonged periods may allow a hedgehog protein in powder form. The present sequence represents a human con increased the invention to cross the blood-brain barrier, and an increased the invention to cross the blood-brain barrier, and an concern of the invention to cross the blood-brain barrier, and an increased the invention to cross the blood-brain barrier, and an concern of the constant protein protein protein protein protein protein of the invention to cross the blood-brain barrier, and an increased the protein of the constant protein protein protein protein protein protein of the constant protein protei
